Aykut Eren Şahin

Pendik, Istanbul, Turkey • +90 546 150 08 31 • aykuterensahin@gmail.com • GitHub • LinkedIn

Education

ATILIM UNIVERSITY Ankara, Turkey | Graduated Jul 2026

B.S., Computer Engineering (English), Full Merit Scholarship (National University Entrance Exam)

Coursework: Deep Learning, Data Structures, Databases, Probability & Statistics, Linear Algebra

Experience

MADDUCK Istanbul, Turkey

Data Intern Jul 2025 – Sep 2025

- Built an end-to-end case handling workflow integrating Google Sheets, Slack, and Lemlist APIs to streamline sales lead qualification.
- Automated recurring reporting with a Python pipeline on an AWS server that fetches, transforms, and writes cleaned data to Google Sheets.
- Engineered a Pipedrive–Asana automation (scheduled services) that creates and assigns tasks to owners based on deal reply triggers.
- Wrote Google Apps Scripts and Python scripts for data validation, Lemlist bulk import, and market research scraping; documented all workflows as SOPs and playbooks.

ALBARAKA TÜRK Istanbul, Turkey

Data Science Intern Jul 2024 – Aug 2024

- Developed a Prophet-based time-series model (Python, Pandas) to forecast daily user logins for the mobile banking app.
- Built an NLP log analytics system that automatically categorizes Turkish customer requests and complaints (Turkish text preprocessing, TF-IDF, Naive Bayes, Linear SVC).

Projects

AI-Driven Dynamic Insurance Pricing System (Graduation Project) | PyTorch, OpenAI Gym, Scikit-learn, Statsmodels | GitHub

- Architected an end-to-end pipeline replacing static actuarial tables with dynamic pricing, decoupling a deep survival-analysis risk model from a reinforcement learning pricing agent.
- Built a DeepSurv model (non-linear Cox Proportional Hazards MLP with negative log-partial likelihood for right-censored data) on the Vanderbilt BioStats clinical dataset, achieving a C-index of 0.9815 on the test set.
- Trained a DQN agent (premium multipliers 0.8x–1.5x) with a Target Network and reward shaping in a custom OpenAI Gym environment, preventing the baseline agent's reputation collapse while sustaining cumulative profit.

Autonomous IoT Smart Thermostat (Internet of Things Course Project) | Arduino Uno, C/C++, I2C, Ethernet

- Built a closed-loop thermostat: a DS18B20 reading compared with a potentiometer-set target drives a PWM MOSFET heater and fan with ±0.5 °C hysteresis, plus ACS712 current monitoring and DHT11 ambient sensing.
- Added a reed-switch door interlock (PCF8574) that cuts the actuators and raises a warning, and a live web dashboard (2-second refresh) on a W5100 Ethernet Shield.

Leadership and Activities

KODA (RURAL SCHOOLS TRANSFORMATION NETWORK) Ankara, Turkey

Volunteer Team Member 2023 – Present

- Contributed to program R&D and currently provide operational and logistical support in the Running Support Team.

Skills & Interests

- **Programming:** Python, SQL, C/C++, JavaScript (Google Apps Script)
- **AI & Deep Learning:** Deep Learning, Machine Learning, PyTorch, Reinforcement Learning (DQN), Gymnasium (OpenAI Gym), Survival Analysis, NLP, Time-Series Forecasting
- **Data & Libraries:** Pandas, NumPy, Scikit-learn, Statsmodels, Prophet, NLTK, Zemberek
- **Automation & IoT:** API/Webhook integrations, Slack, Lemlist, Pipedrive, Asana, Arduino, I2C/SPI, PWM/MOSFET control
- **Tools & Cloud:** Git/GitHub, Linux, Jupyter, AWS (running Python scripts on a server)
- **Languages:** Turkish (Native), English (Fluent / C1), Japanese (JLPT N5)
